Climate Solutions

Climate Solutions

Our planet is facing a climate crisis. To survive, we must stop burning fossil fuels—yet that alone is not enough. We also need natural climate solutions.

Nature Can Help

Trees absorb carbon dioxide from the air. So do forests, swamps, kelp beds, coral reefs, and more. These natural systems can help repair our climate. Sadly, we spend far more on fossil fuel subsidies than on nature-based solutions. Planting more trees and protecting ecosystems can make a big difference.

We Are Losing Nature

Despite nature's importance, only 2% of climate funding goes to it. Meanwhile, species are going extinct daily, ice is melting, and wildlife is disappearing. Our planet is suffering, and we must act together to save it.

What You Can Do

We must protect, restore, and fund nature. Stop destroying forests. Help damaged ecosystems recover. Support efforts that preserve nature instead of harming it. Many people have started—now it's your turn. Let's take action and protect our future.
