How to Escape a Sinking Car?

1. Stay calm and think clearly

A vehicle usually remains afloat for 30 seconds to two minutes. This short period gives you **plenty** of time to escape if you stay **calm** and act quickly. Keeping strong **mental** focus will help you make smart decisions.

2. Do not try to open the door

Opening a car door in water is extremely difficult because of the strong water pressure. This **scenario** can make the car **sinking** faster, trapping every **passenger** inside.

3. Follow this order: "Seatbelts – Kids – Windows – Exit."

First, **unbuckle** your **seatbelt**. If it is stuck, cut it. Then assist children or any other **passenger** who needs help. Get ready to escape through a window—not the door.

4. Help children and other passengers

Make sure they **unbuckle** their **seatbelts**. If possible, guide them to exit through their own window. If not, lead them to the nearest window at the front.

5. Use the window as your escape route

Try lowering the window **immediately**. If it does not open, use a window-breaking tool to smash it. Car windows are designed to be very strong, so breaking them with your hands or feet is nearly impossible.

6. Swim out and move toward a safe area

Once outside the window, push away from the vehicle and swim toward safety. Staying **calm** and knowing these steps can help you escape in less than a minute.
